# U.S. 2016 Energy Flow – 97.3Quads

Estimated U.S. Energy Consumption in 2016: 97.3 Quads

“This year marks two changes to the energy flow chart. The Energy Information Administration has changed the way it analyzes and reports renewable energy use, and those changes are reflected in the 2016 chart as well as a revision to the 2015 analysis. Additionally, the estimate of efficiency of the industrial sector has been reduced from 80 percent to 49 percent to align with recent analysis at the DOE’s Advanced Manufacturing Office. LLNL reports all year-over-year changes on a consistent basis with the new methodology.”

# Demand Response

# Demand Response

- DR as changes (usually reductions) in electricity **usage by end-use customers from their normal** consumption patterns.
- In response to **changes in the price of electricity or to direct incentives**, typically at times of high wholesale market prices or when system reliability is jeopardized.
- An important distinction for DR is that it must be **dispatchable by a utility or system operator** or be initiated by a customer in response to a non-fixed price signal.

**Demand Response is an important component of “Smart Grid”**

# Time of Day Rates Encourage Customer DR

Summer				
	On-Peak	Mid-Peak	Off-Peak	Total

# “The Big Picture: Next-Gen Nuclear”

- Compliments of Power magazine April 2014
- 72 mostly advanced nuclear reactions under construction
- A total of 68GW (12% of installed base)
- China represents 40% of the total
- France will cap nuclear capacity at the current 63.2GW, forcing closures w/capacity additions
  - Currently at 75% share of generation
  - Goal is 50% by 2025

Westinghouse AP1000® plant under construction in Sanmen, China

Installed Generating Capacity (2012) = 5,550 GW

# France Walks Back Nuclear Commitment

---

- PARIS (AP) — France's environment minister is backing down on promises to sharply reduce nuclear Power Production so that the government can concentrate on reducing fossil fuels instead.
- Nicolas Hulot told reporters Tuesday that **it's too "brutal and unrealistic" to meet earlier pledges to cap the amount of France's electricity produced by nuclear plants at 50 percent by 2025.**
- Hulot said President Emmanuel Macron's government remains committed to reducing nuclear energy and ordered his ministry to produce a new timetable.
- But Hulot made clear his priority is weaning France's economy from fuel that contributes to global warming. His ambitious goals include banning all sales of gasoline and diesel cars by 2040.
- France depends more on nuclear energy than any other country, getting about three-quarters of its electricity from its 58 nuclear plants.

November 7, 2017

# Advanced Nuclear

## Heat Exchangers are a Challenge

### MSR: FROM THORIUM TO ENERGY

This ongoing decay (from Thorium to Uranium) will generate large amounts of energy in the form of heat. This heat can be transported through a gas in a heat exchanger and transferred to a turbine connected to a generator which will produce electricity.

ELYSIUM INDUSTRIES | TECHNICAL DECK

Fission fuel produces fission products and actinides. Fission products only stay toxic for about 200 years while many actinides stay toxic for over 30 000 years. Molten Salt Reactors can fully recycle actinide wastes and only emit fission product wastes. This results in nuclear waste remaining toxic for only about 200 years as opposed to thousands of years for other nuclear reactors.

## Generating electricity

A power station produces electricity by changing the energy in its fuel into electrical energy. A gas-fired power station burns gas, converting its chemical energy into heat. The burning gas expands and tries to rush out in all directions—it has kinetic energy. It turns the blades of a turbine, which drives a generator to make electricity. The hot gas also turns water into steam, which drives another turbine and generator. Condensers change the steam back into water so that it can be used again.

*“Practical Strategies for Emerging Energy Technologies”*

# U.S. Hydro Capacity is Very Old

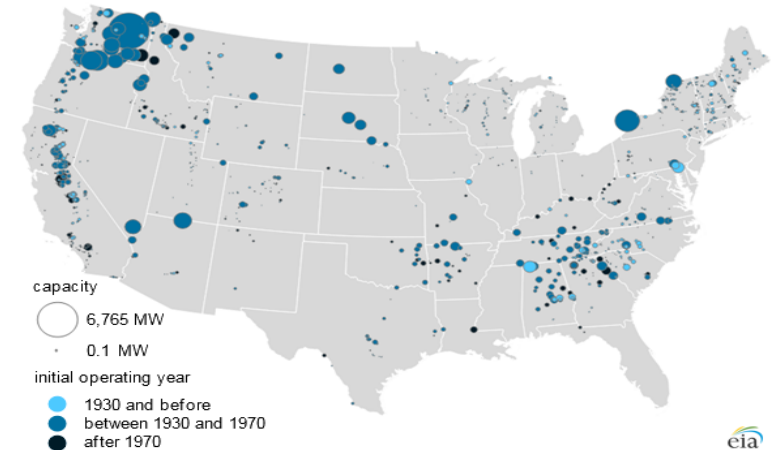

Conventional hydroelectric net generation  
million megawatthours

Conventional hydroelectric capacity factors  
percent

Distribution of conventional hydroelectric plants in the Lower 48 states

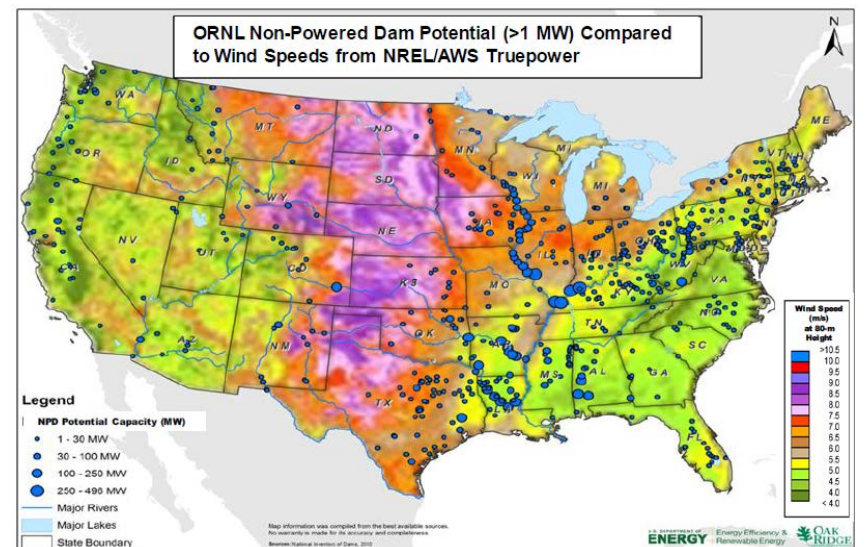

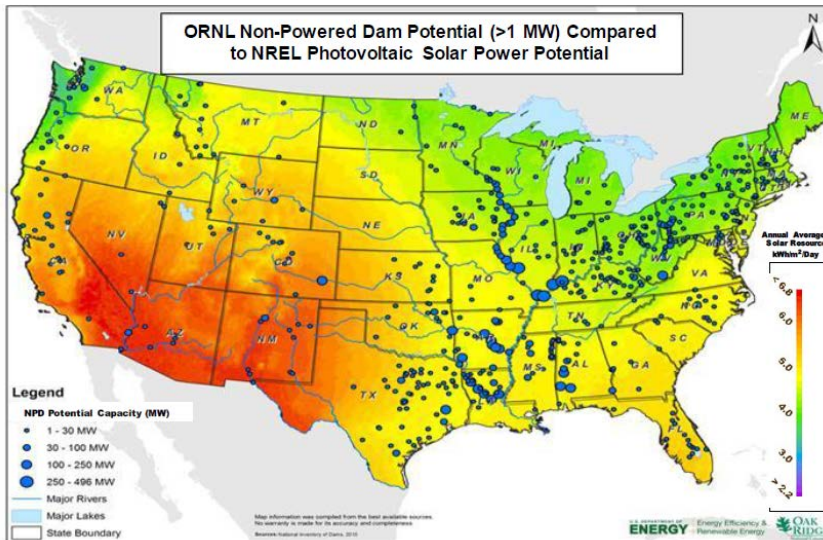

- Conventional hydroelectric generators account for 7% of the operating electricity generating capacity in the United States and about 6% to 7% of U.S. electricity generation each year.
- **Hydropower plants account for 99% of all currently operating capacity built before 1930**
- The 50 oldest electric generating plants in the United States are all hydroelectric generators; each has been in service since 1908.
- Many reservoirs must balance power output with competing water demand for irrigation, municipal, industrial, and other needs, as well as concerns with fish migration.
- As a result, hydroelectric facilities often do not run at full output. U.S. hydroelectric capacity factors, which measure actual output as a percent of total capacity, average between 30% and 40%.

Turbine

Hinge

Feet 8m

43m Tether arm

**Tidal flow**

Hinge Allows for constant change of geometry in the device

Gravity anchorage or seabed fixing

TIDAL CURRENTS	CONCEPT	INSTALLATION	OUTPUT
Electricity generation from tidal current energy has great potential worldwide. The largest resources are the US, UK, Norway and the Mediterranean. There are also large potential tidal resources in Australia and the Far East	TidalStream is designed for deep water where rigidly mounting turbines is not viable and it is otherwise too rough for surface floating devices. Turbines are mounted on semi-submersible spar buoys tethered to the seabed with gravity anchorages	The intention is for the turbine to be floated to the installation position and then rotated into the upright configuration utilising onboard buoyancy systems. When it is necessary to maintain or repair the unit the same system will bring the structure back to the surface	The current project activity is the design of a twin rotor <b>2MW</b> development installation. Eventually installations of up to <b>4MW</b> are envisaged
			<b>2MW</b> 2 turbine device
			<b>4MW</b> 4 turbine device

# Renewable Portfolio Standards

## Renewable Portfolio Standard Legislation as of May 2015

- Seven states—Hawaii, California, Nevada, Colorado, Minnesota, Connecticut, and Oregon—have effective RPS requirements of 25 percent or greater.
- Six states – CA, MI, NY, MN, IL and VT – are seriously debating an increase in their RPS this year.
- Ohio: With the signing of Senate Bill 310 in 2014, Ohio became the only state to “freeze” its RPS, effectively halting the state’s mandates for efficiency and renewables until 2017. In 2017, these standards should pick up where they left off when the freeze occurred, however an Energy Mandates Study Committee is reviewing wholesale changes to the standard. In this context of policy uncertainty, renewable energy employment and investment is moving away, to more welcoming states.
- Legislators in four states (CO, MT, CT, and NH) have voted down proposals to diminish or repeal RPS policies this year.

AEO 2015 Total U.S. renewable generation by fuel in 2013 & six 2040 cases (billion kWh)

Net total available to the grid

2013	= 3,888 billion kWh (~14%)
2040 Ref	= 4,672 billion kWh (~19%)

- Renewables get to dispatch first
- If they can make power, the grid has to take it
- Imposing their inherent variability on the entire grid

Source: American Wind Energy Association (AWEA)

# Summary of PTC & ITC Extension Phase Down

---

- The final extension of the PTC and ITC occurred in the FY16 Omnibus Appropriations Bill, passed on December 18, 2015
  - Included a five-year extension and phase-down of the PTC
  - As well as the option to elect the investment tax credit for wind energy
- The tax credits, extended through 2019, have begun phasing down by 20 percent each year beginning in 2017
  - PTC wind projects that started construction
    - 2015 and 2016 receive a full value PTC of 2.4 cents per kilowatt hour.
    - 2017, the credit is at 80 percent of full value
    - 2018, 60 percent PTC
    - 2019, 40 percent PTC.
  - The ITC election for wind energy projects that started construction
    - 2015 and 2016 are eligible for a full 30 percent ITC
    - 2017, a 24 percent ITC
    - 2018, an 18 percent ITC
    - 2019, a 12 percent ITC.
- Rules will allow wind projects to qualify as long as they start construction before the end of the period.

# Renewables Levelized Cost 2010 & 2014

Source: IRENA Renewable Cost Database.

Note: Size of the diameter of the circle represents the size of the project. The centre of each circle is the value for the cost of each project on the Y axis. Real weighted average cost of capital is 7.5% in OECD countries and China; 10% in the rest of the world.

# Dealing with an even “Bigger” Duck

California Duck Renewable Generation 1

The California Duck is a graphic published by the California Independent System Operator that projects the expected need for non-renewable generation over a 24-hour day. Each line in the duck is a different year from 2013 to 2020. As time marches on and more solar generation is placed on line, the non-renewable demand drops during midday. The change in hourly demand drives the 2013 line, the duck's back. The solar generation that will be online by 2020 results in a dip in non-renewable demand during midday – the duck's belly.

The Duck Pond of Non-Renewable Generation 2

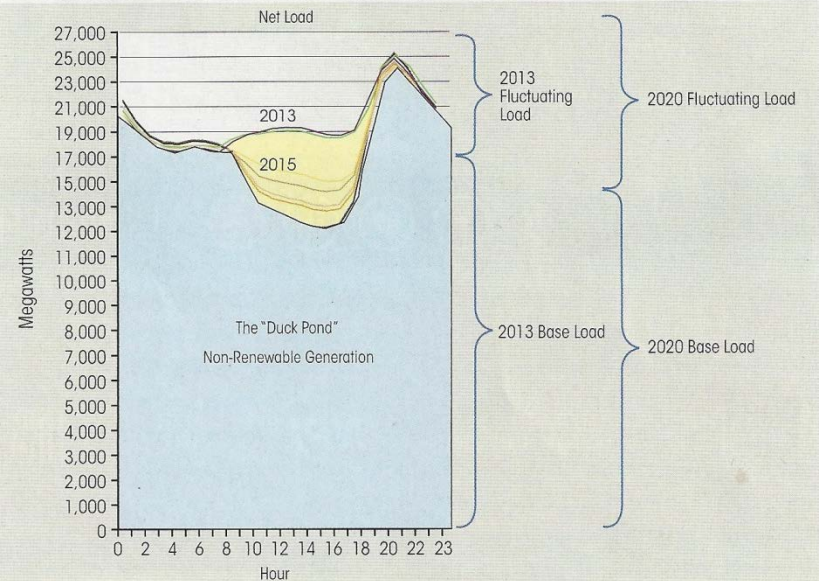

Figure 2 is an expansion of Figure 1, showing the amount of generation under the duck.

# Integrating Renewables “Dealing with The Duck”

## All about correlation

And, load factors decline!

“Practical Strategies for Emerging Energy Technologies”

# Germany Energiewende

- **Energiewende at a new turning point**
- **No more than 45%** renewable energy by 2025
- Goal for completing underground transmission lines for wind in the north to industry in the south by 2022
- Rapidly decreasing load factors are killing financial returns of old-line power producers
- Conventional utilities restructuring into:
  - Legacy assets
  - Renewables
- RWE mothballed a brand new billion-euro Westfalen-D coal-fired plant
  - Damaged at start-up
  - Decision not to correct error, but to de-construct plant
- E.ON applied to shutter two new gas-fired unit in 2015 as unprofitable
- Merit Order Dispatch Consequences
  - First determined based on fuel input cost
  - However, all renewable energy must be absorbed first
  - Dispatch order is solar, wind, hydro, biomass, nuclear, lignite, hard coal, and then natural gas.
  - Germany burns imported hard coal, generating excess capacity, export that capacity elsewhere in Europe
  - New gas plants cannot compete

**1. The path to more renewables in Germany.** Renewable energy sources (RES) already supply about a third of the country's electricity. *Source: Agora Energiewende; data from AG Energiebilanzen 2015*

**3. Marginal costs for new gas and old coal power plants 2008-2015.** Despite lower prices for natural gas and slightly higher CO<sub>2</sub> prices, new gas plants cannot compete against old coal plants. *Source: Agora Energiewende*

# La Paloma Plant Going Bankrupt

A natural gas-fired power plant in California that earlier this year warned it might need to shut down filed for bankruptcy protection on Tuesday, blaming "inhospitable" regulations and a shift toward renewable energy for power generation.

La Paloma Generating Co LLC [CMENGL.UL], a 1,200 megawatt combined cycle plant about 110 miles northwest of Los Angeles, filed for U.S. Chapter 11 bankruptcy in Delaware on Tuesday, citing \$524 million of debt.

In its filing, La Paloma said market factors including slower-than-expected growth in electricity demand and a rise in renewable generation resources in California were "exacerbated by an inhospitable regulatory environment."

La Paloma is owned by Rockland Capital LLC, one of several California plant owners that has asked the state for help in offsetting losses, arguing that it is in the state's interest to support the natural gas plants because they provide stability and reliability to the power grid.

An unexpected combination of oversupply of natural gas and a boom in solar and other renewable energy has depressed power prices and threatened the viability of natural gas plants that sell power into California's electricity market.

In its court filing, La Paloma said it had decided that Chapter 11 was in the best interests of the company and its creditors and stakeholders, following consultation with financial and legal advisers.

The company listed Bank of America Corp (BAC.N) and SunTrust Bank [STIHC.B.UL] as its lenders. It has trade debt with a number of organizations including Alstom Power Inc, the West Kern Water District and Pacific Gas & Electric Co (PCG\_pa.A).

# Exelon's Texas merchant subsidiary files bankruptcy

---

- ExGen Texas Power owned five generating facilities in the Lone Star state, but the bankruptcy agreement will change that.
- Exelon blamed the financial woes on "historically low power prices within Texas" that created "challenging market conditions for all power generators, including the five natural gas-fired EGTP plants."
- The Exelon development comes as Vistra Energy announced plans to close three coal-fired power plants in Texas — part of the 5,625 MW of fossil fuel capacity that is slated to be retired or mothballed in the state in the coming year.
- EGTP owns two combined-cycle gas plants, two gas-fired steam boilers and a small simple-cycle plant.
- Cheap gas has been pushing coal off the grid in some markets, and Texas' wind power is now having some of the same effect on gas. The Handley plant is a 3-unit, 1,265 MW facility located in Fort Worth, providing electricity to customers in the Electric Reliability Council of Texas.

# Australia's rooftop solar brings grid demand to historic lows

02/11/2017

By [Tildy Bayar](#)

Features Editor

-----  
Demand for grid power in the state of Western [Australia](#) has fallen to an eight-year low thanks in part to rooftop [solar](#) installations, Australian renewables news site ReNew Economy found.

Grid power demand fell to a record low of 1265 MW last Sunday during a midday interval when rooftop PV systems generated 420 MW.

And WA's grid operator expects the growing amount of rooftop solar in the state to reduce the amount of grid power demand to zero on some days. It is anticipated that PV systems could power businesses and two-thirds of homes within a decade.

Rooftop PV installations in WA are up 49 per cent this year on 2016 levels, standing at 785 MW.

And the trend is seen in other states too. Figures from the Australian PV Institute show that 1.5 million rooftop PV systems installed in New South Wales, while a Climate Council report shows that 50 per cent of residential buildings have rooftop solar in Queensland where 50 per cent of residential buildings have rooftop solar. South Australia's grid demand hit a record low in September, with just 588 MW of demand in the afternoon when rooftop PV generated over 700 MW.

“Practical Strategies for Emerging Energy Technologies”

# Definitions - NOPR

Notice of Proposed Rulemaking (NOPR)

- **Baseload Power Supply** is a term used to describe generation that falls at the bottom of the economic dispatch stack, meaning those power plants are the most economical to run
  - Coal and nuclear resources are designed for low cost O&M and continuous operation
  - These conventional steam-driven generation resources have low forced and maintenance outage hours and have low exposure to fuel supply chain issues
- **Variable Renewable Energy (VRE)** is a source that is non-dispatchable due to its fluctuating nature, like wind and solar
- **Controllable Renewable Energy (CRE?)** source such as hydroelectric, or biomass, or a relatively constant source such as geothermal power or run-of-the-river hydro

“Baseload” generation is not a requirement; however, having a portion of a resource fleet with high reliability characteristics, such as low forced and maintenance outage rates and low exposure to fuel supply chain issues, is one of the most fundamental necessities of a reliable Baseload Power Supply (BPS)

# Reserves Definition

		Operating Reserves		Planned Reserves	
		Regulating Reserve (a)	Other On-Line Reserve (d)	Operations Planning / Unit Commitment (f)	System Planning / Resource Installation (g)
On-Line		Spinning Reserve (b)			
		Non-Spinning Reserve (c) such as Interruptible Load Fast-Start Generation	Other Off-Line Reserve (e) such as Curtable Load Off-Line Units		
Off-Line					
		<b>&lt;= 10 min</b>	<b>10-60 min</b>	hours to days	weeks to years

---

# Storage

# Energy Storage Technologies

# Pumped Hydro Storage

Principle of a pumped-storage power plant

-  Direction of water flows when generating
-  Direction of water flows when pumping
-  Rotation when generating
-  Rotation when pumping

-  Direction of power flows when generating
-  Direction of power flows when pumping

# Compressed Air Energy Storage (CAES)

Split the two components of a gas turbine

1. Compressor

2. Turbine (Expander)

So they can operate at different time(s) of day

Turbine may be “fired” or “un-fired”

---

# Carbon Capture Utilization & Storage (CCUS)

# Annual U.S. CO<sub>2</sub> Utilization vs. Emissions

## Gaseous Consumption

Mainly enhanced oil recovery

## Liquid/Solid Consumption

Mainly Food

**Total Utilization ~ 100 Mt**

Sources: SRI Consulting, MIT, UT Austin

## 5 Largest CO<sub>2</sub> Emitters in 2009

Plant	Location	CO <sub>2</sub> , Mt/yr	GWe
1 Scherer	Juliette, GA	25.0	3.56
2 Bowen	Cartersville, GA	20.8	3.50
3 Miller	Quinton, AL	23.3	2.82
4 Martin Lake	Tatum, TX	26.0	2.38
5 Gibson	Owensville, IN	22.2	3.34
<b>Total</b>		<b>117.3</b>	<b>15.6</b>

U.S. Utilization = 100 Mt  
 = Emissions 5 large plants  
 U.S. Emissions = 2400 Mt from utility  
 = 6000 Mt total

Sources: EPA, IEA

DOE estimates ~25% of coal power CO<sub>2</sub> emissions could be used for EOR, if ~\$30/t

5

**We do not grasp the scale of the problem**

**base**<sub>e</sub>

“Practical Strategies for Emerging Energy Technologies”

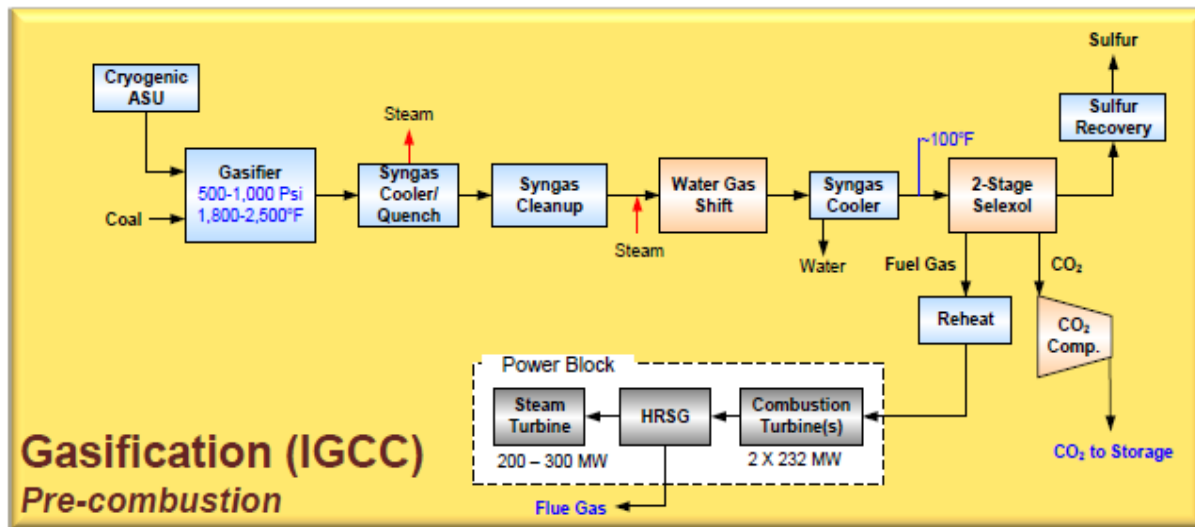

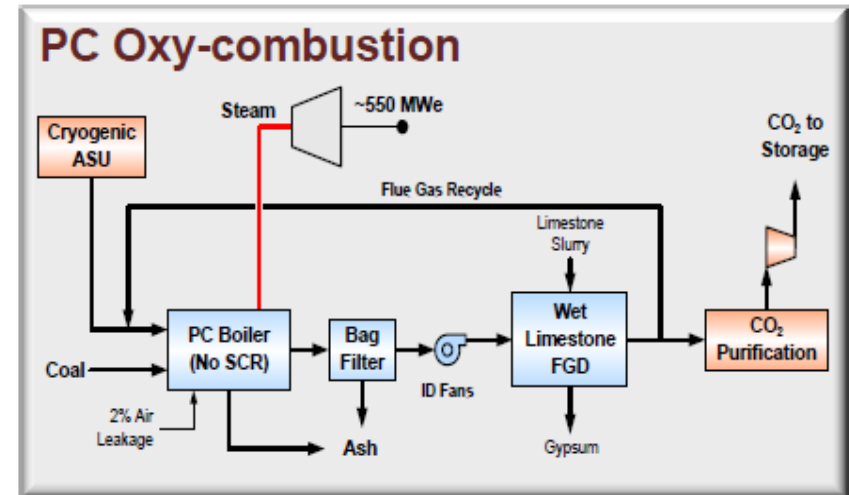

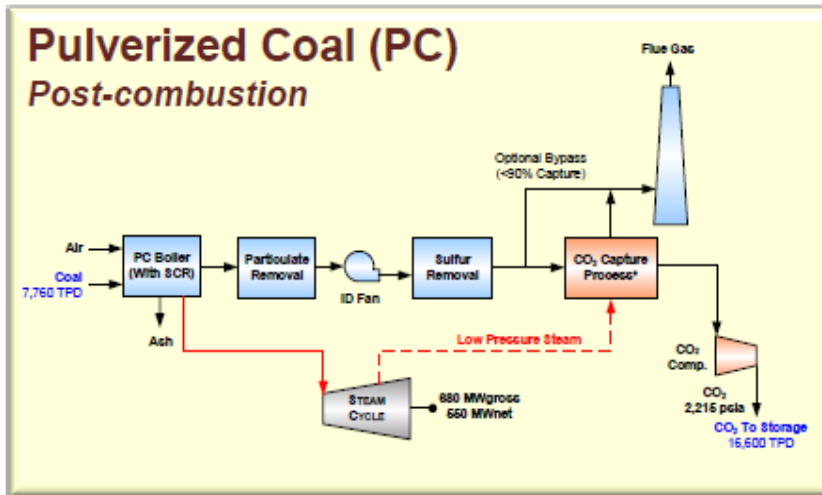

# EPRI CO<sub>2</sub> Utilization

---

- CO<sub>2</sub> chemical conversion to fuels
  - Requires ~6-15 times more energy produced
  - Uses CO<sub>2</sub> as energy storage – other options much better
- CO<sub>2</sub> conversion to other chemicals
  - Requires more energy and/or reactants than produced
  - Scale mismatch - CO<sub>2</sub> production dwarfs other chemicals
- Mineralization
  - Emits >50% of carbon captured at low capture efficiency
  - Scale of reactants, energy needed, low conversion
- Biological conversion
  - Land use requirement: size of Ohio for US coal fleet
  - Significant energy cost: EROI <2

# CO<sub>2</sub> Power Plant/Capture Options

Costs of CO<sub>2</sub> avoided

Source: Global CCS Institute Victor Der July 2013

# McKinsey Global GHG Cost Curve V2.1

Note: The curve presents an estimate of the maximum potential of all technical GHG abatement measures below €80 per tCO<sub>2</sub>e if each lever was pursued aggressively. It is not a forecast of what role different abatement measures and technologies will play.

Source: Global GHG Abatement Cost Curve v2.1

# CO<sub>2</sub> Pricing

Source: On Climate Change Policy

## Carbon pricing is spreading

- Prices are far too low to price emissions efficiently
- The vast majority of priced emissions – about 90% of the total – are priced below \$14/tCO<sub>2</sub>
- Higher carbon prices are invariably for small volumes, and are found in Europe, British Columbia and Alberta
- The environmental damage caused by emissions – as estimated the US EPA
- Carbon prices are thus too low even compared with a likely underestimate of the cost of emissions
- Taxes are too low and caps are too loose to price carbon adequately
- Consequently efficient abatement is not happening.

## Substantial Costs for CO<sub>2</sub> Mitigation

# Enhanced Oil Recovery

**EOR Economic Payback**  
**(1) Mt CO<sub>2</sub> Produces (3) Barrels of Oil**

**base**<sub>e</sub>

*“Practical Strategies for Emerging Energy Technologies”*

# Enhanced Oil Recovery

## – Enhance Oil Recovery (EOR)

- Near term application
- Recover up to 15% more oil from existing reservoirs
- Extend useful life by 25 years
- Substitute for natural gas re-injection
- \$800 million annual market potential

## – Enhanced Coal Bed Methane

- R&D efforts focused on similar use and effects

## – Oil Shale & Tar Sands

- 1 trillion bbl oil equivalent
- In-situ methods under investigation
- Potential CO<sub>2</sub> use
  - Stimulate production
  - Moderate in-situ combustion

“Practical Strategies for Emerging Energy Technologies”

# British Columbia Carbon Tax “Success”

- “Successful implementation”
  - 16% drop in consumption after introduction in 2008
- Initially \$C10/tonne, increasing to current \$C30/tonne
  - \$C30/tonne = 7 cents/liter = 26.5 cents/gallon
- Use of ½ Carbon Tax funds for Regional Transit expansion denied
- A 2<sup>nd</sup> Carbon Tax is being discussed to fund the Region’s Transit expansion

“The goal of the carbon tax, reducing carbon, is just completely synchronous with public transit funding and getting people out of cars,” he said. “Regardless of what the minister has said, we still believe it’s the best source.”

“Practical Strategies for Emerging Energy Technologies”

# Corn Ethanol Energy Balance

# Air Capture

As we move to commercialization, we envision industrial-scale air capture facilities, sited outside of cities and on non-agricultural land, that supply CO<sub>2</sub> for fuel synthesis, and eventually for direct sequestration to compensate for emissions that are too challenging or costly to eliminate at source. At this large scale, our technology will be able to achieve costs of \$100-150 USD per tonne of CO<sub>2</sub> captured, purified, and compressed to 150 bar.

Barrels	0.1364	0.159	1	42	-
US gallons	0.00325	0.0038	0.0238	1	-
Barrels per day	-	-	-	-	49.8

\*Based on worldwide average gravity.

### Products

	To convert			
	barrels to tonnes	tonnes to barrels	kilolitres to tonnes	tonnes to kilolitres
	<b>Multiply by</b>			
Liquefied petroleum gas (LPG)	0.086	11.60	0.542	1.844
Gasoline	0.120	8.35	0.753	1.328
Kerosene	0.127	7.88	0.798	1.253
Gas oil/diesel	0.134	7.46	0.843	1.186
Residual fuel oil	0.157	6.35	0.991	1.010
Product basket	0.125	7.98	0.788	1.269

### Natural gas (NG) and liquefied natural gas (LNG)

From	To					
	billion cubic metres NG	billion cubic feet NG	million tonnes oil equivalent	million tonnes LNG	trillion British thermal units	million barrels oil equivalent
	<b>Multiply by</b>					
1 billion cubic metres NG	1	35.3	0.90	0.74	35.7	6.60
1 billion cubic feet NG	0.028	1	0.025	0.021	1.01	0.19
1 million tonnes oil equivalent	1.11	39.2	1	0.82	39.7	7.33
1 million tonnes LNG	1.36	48.0	1.22	1	48.6	8.97
1 trillion British thermal units	0.028	0.99	0.025	0.021	1	0.18
1 million barrels oil equivalent	0.15	5.35	0.14	0.11	5.41	1

### Units

1 metric tonne	= 2204.62lb
	= 1.1023 short tons
1 kilolitre	= 6.2898 barrels
	= 1 cubic metre
1 kilocalorie (kcal)	= 4.187kJ
	= 3.968Btu
1 kilojoule (kJ)	= 0.239kcal
	= 0.948Btu
1 British thermal unit (Btu)	= 0.252kcal
	= 1.055kJ
1 kilowatt-hour (kWh)	= 860kcal
	= 3600kJ
	= 3412Btu

### Calorific equivalents

One tonne of oil equivalent equals approximately:

Heat units	10 million kilocalories
	42 gigajoules
	40 million British thermal units
Solid fuels	1.5 tonnes of hard coal
	3 tonnes of lignite
Gaseous fuels	See Natural gas and liquefied natural gas table
Electricity	12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

1 barrel of ethanol = 0.57 barrel of oil  
1 barrel of biodiesel = 0.88 barrel of oil
